Dendritic cell function is impaired in HIV-1 infection. Dendritic cells (DCs) are professional antigen presenting cells (APCs) that bridge the innate and adaptive immune responses, and they are the main initiators of the T cell responses. Alterations in the functions of DCs are associated with impaired immune responses and disease progression in HIV-1 infection. However, in-depth study of DCs in HIV-1 infection remains challenging due to difficulties in the identification and purification of DCs. In the present study, we developed a method to purify DCs, which were then used to investigate the functions of DCs in HIV-1 infection. The results demonstrated that HIV-1 infection inhibited the differentiation and function of DCs. Furthermore, the impaired functions of DCs were dependent on TNF- α secretion. The high level of TNF- α inhibited the differentiation and function of DCs by interfering with the development of functional dendritic cell lineage. Therefore, 82157476af
